

# Reading a Ruler

The ruler below measures from 0 to 1.

Divide the distance from 0 to 1 into 2 equal pieces. Each piece is  $\frac{1}{2}$  the total distance.

We start measuring at 0 and move toward 1.

This screw is  
 $\frac{1}{2}$  inch long.

Divide the distance from 0 to 1 into 4 equal pieces. Each piece is  $\frac{1}{4}$  the total distance.

$$\frac{1}{4}$$

$$\frac{2}{4}$$

$$\frac{3}{4}$$

$$\frac{4}{4}$$

We still call the tallest line  $\frac{1}{2}$ .

The next tallest lines are both fourths:  $\frac{1}{4}$  and  $\frac{3}{4}$ .

What about  $\frac{4}{4}$ ? That's the same thing as 1.

Divide the distance from 0 to 1 into 8 equal pieces. Each piece is  $\frac{1}{8}$  the total distance.

The second shortest lines are all eighths:  
 $\frac{1}{8}$ ,  $\frac{3}{8}$ ,  $\frac{5}{8}$ , and  $\frac{7}{8}$ .

0

$\frac{1}{8}$     $\frac{2}{8}$     $\frac{3}{8}$     $\frac{4}{8}$     $\frac{5}{8}$     $\frac{6}{8}$     $\frac{7}{8}$     $\frac{8}{8}$

The second shortest lines are all eighths:  
 $1/8$ ,  $3/8$ ,  $5/8$ , and  $7/8$ .

What about  $2/8$ ? That is the same thing as  $1/4$ .

The second shortest lines are all eighths:  
 $\frac{1}{8}$ ,  $\frac{3}{8}$ ,  $\frac{5}{8}$ , and  $\frac{7}{8}$ .

$$\frac{4}{8} \qquad \frac{6}{8} \qquad \frac{8}{8}$$

What about  $\frac{4}{8}$ ? That is the same thing as  $\frac{1}{2}$ .

The second shortest lines are all eighths:  
 $\frac{1}{8}$ ,  $\frac{3}{8}$ ,  $\frac{5}{8}$ , and  $\frac{7}{8}$ .

$$\frac{6}{8} \qquad \frac{8}{8}$$

What about  $\frac{6}{8}$ ? That is the same thing as  $\frac{3}{4}$ .

The second shortest lines are all eighths:  
 $\frac{1}{8}$ ,  $\frac{3}{8}$ ,  $\frac{5}{8}$ , and  $\frac{7}{8}$ .

$$\frac{8}{8}$$

What about  $\frac{8}{8}$ ? That is the same thing as 1.

Divide the distance from 0 to 1 into 16 equal pieces. Each piece is  $\frac{1}{16}$  the total distance.

The shortest lines are 16ths.

0

$\frac{1}{16}$	$\frac{2}{16}$	$\frac{3}{16}$	$\frac{4}{16}$	$\frac{5}{16}$	$\frac{6}{16}$	$\frac{7}{16}$	$\frac{8}{16}$	$\frac{9}{16}$	$\frac{10}{16}$	$\frac{11}{16}$	$\frac{12}{16}$	$\frac{13}{16}$	$\frac{14}{16}$	$\frac{15}{16}$	$\frac{16}{16}$
----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------

0

$$\frac{2}{16} \quad \frac{4}{16} \quad \frac{6}{16} \quad \frac{8}{16} \quad \frac{10}{16} \quad \frac{12}{16} \quad \frac{14}{16} \quad \frac{16}{16}$$

What about  $\frac{8}{16}$ ? That's the same as  $\frac{1}{2}$ .

Notice that all of your ruler fractions are odd numbers in the numerator divided by even numbers in the denominator.

Odd  
Even

Are you having trouble remembering these fractions?

Money always makes things easier.

Let's count up to a dollar in quarters.

4 quarters = 1 dollar

Now let's put in the eighths using  
the second shortest lines,  
remembering to count in odd numbers.

Now let's put in the sixteenths  
using the shortest lines,  
remembering to count in odd numbers.

Now you know how to  
read a ruler. Practice it  
every day so you will not  
forget it.
